THE COMPANY

We invest in technology to produce the future

Isopan specially deals with the production and marketing of insulating panels with metal supports, for roofs and walls with a high isothermal coefficient.

The product range also includes the fixture assemblies, the flashings for finishing and for collecting rainwater, translucent ribbed panels, windows to fit into walls, and fixed or motorised skylights.

The insulating materials produced by Isopan comply with the highest quality standards.

Today this means a production philosophy which pays maximum attention to technological innovation, so as to be able to offer cutting-edge solutions to the most demanding requirements in the field of advanced modern methods for civil and industrial buildings.

Isopan panels are made by a continuous process, which ensures uniform and constant quality, controlled by advanced diagnostic equipment. Polyurethane and polyisocyanurate foams, which are both self-extinguishing are injected at high pressure using exclusive Isopan technology to make panels with a completely monolithic structure, with excellent thermal insulation and high mechanical strength.

Research and development in recent years have allowed the production of sound-absorbing panels, panels for refrigerated cells, building panels and panels with high fire resistance. In its ultra-modern Services Centre, Isopan produces all the flashings and a wide range of ribbed and collaborating sheets, which complete the Isopan System. It is the quality of the materials used which gives durability to the metal supporting structure.

Isopan: a service that delivers content

Being able to listen and wanting to understand are the basic conditions for transforming good intentions into effective and incisive service to the customer.

Applying this concept is what gives practical value to Isopan's Customer Service.

Our team of professionals is kept informed by a constant stream of data and information, and works closely with customers to interpret their specific requirements.

We invest heavily in the human resources dedicated to Customer Service, and this complements our solid commitment to research and development devoted to the product. The technical properties of our rolled metal profiles are regularly tested on the line and in the laboratory, for continual improvement in qualitative content.

We pay particular attention to the chemistry of polyurethanes, in order to develop and expand the fields of application of the resins.

Our state-of-the-art logistical structure ensures that orders are despatched on time and as agreed. Strict integration between the manufacturing and distribution operations ensures ultra-fast delivery times in Italy and abroad.

Isopan: a single large market

Isopan has a presence in the most important markets in the world through a consolidated network of direct and indirect agents.

The Export Division offers specific solutions for the different foreign markets we supply, with its own flexible manufacturing capability supported by its own European production facilities, a rapid transport system and an efficient technical assistance service.

The company's commitment to foreign markets means that we are represented at the principal international trade fairs in the field, where the quality of Isopan products never fails to make an impression from every point of view.

Choosing quality as the corporate philosophy

Working for Quality means never disappointing our customers, and Isopan knows that the first step on this road is the technical performance of the product.

The commitment to Quality Certification is one among many which Isopan has made to maintain the high qualitative level of its output. This is the reason why we will only accept suppliers with the capacity to deliver materials of proven reliability, always guaranteed and certified, in full compliance with international Standards.

Our panels consist essentially of an insulating core of polyurethane, with a backing of profiled metal, and must be capable of providing a double barrier: one against corrosion, the other against heat dispersal. For this reason we use selected components such as: rolled steel sheets protected with a zinc coating and a film of paint, to put up a powerful barrier to deterioration caused by atmospheric agents, and expanded polyurethanes and polyisocyanurates, the most effective known insulators for combating heat transmission.

The selected backing sheets are rigorously checked for uniformity of surface, high adherence of the zinc to the steel, and perfect adhesion of the points to the backing sheet. The paints themselves are chosen for their suitability in view of the aggressiveness of the atmosphere to which they will be exposed.

The rigid, closed-cell, high-density polyurethane component is well-known for its high and constant insulating value, its outstanding physical characteristics (verified by stringent tests of compression, bending and dimensional stability), and its good performance in self-extinguishing.

The panel functions as a monolithic structure: this is ensured by a special primer applied to the metal backing which produces excellent adhesion of the insulation.

With a turnover of over 425 million Euros and 725 employees, the Gruppo Manni is strengthening its leading position in the Italian market for prefabricated steel products intended for the construction and engineering industries and in the field of standard and special insulating panels.

Overall, the Gruppo Manni produces more than half a million tons of semi-finished and finished steel products.

The heart of the Group's business plan is the continuous search for excellence in serving the customer.

This is expressed in the company **mission**: to be the customer's preferred partner supplier on the basis of quality and of our capacity to interpret and anticipate the customer's needs, thus ensuring profitable growth for the company, our collaborators and our customers. We aim to be a partner for our suppliers in building deep and stable relationships, focused on development and sharing knowledge.

The **vision** which guides the company's activity envisages a larger and more organised geographical distribution within Italy, with representation in new areas of Europe and a continuous search for solutions in design, technology and product manufacture to satisfy customers' requirements.

Our **development strategy** puts the customer at the centre, so that together with our workforce the customer becomes a driving force for innovation in products and services, united by our professional relationships in the search for new value. Creating relationships on a professional basis with customers and contributing with them to finding innovative solutions means transferring part of the capital which the Group has accumulated within itself and watching it grow together with the value which the customer perceives in our services.

The companies in the Group have a uniform vision which is directed towards maximising value in favour of all the stakeholders (customers, suppliers, finance providers, employees and shareholders), with the object of obtaining a good, durable and secure return.

Careful management of the **relational capital** leads to an exchange of information with customers which nourishes and improves our knowledge.

The **human capital** is enhanced by contact with the market and by extension of knowledge through internal development projects. Better understanding of the real needs of customers and of the chain of utilisation of products and services leads us to introduce innovations.

Increase, including qualitative increase, in the **structural capital** is a means of enabling growth, which then spreads.

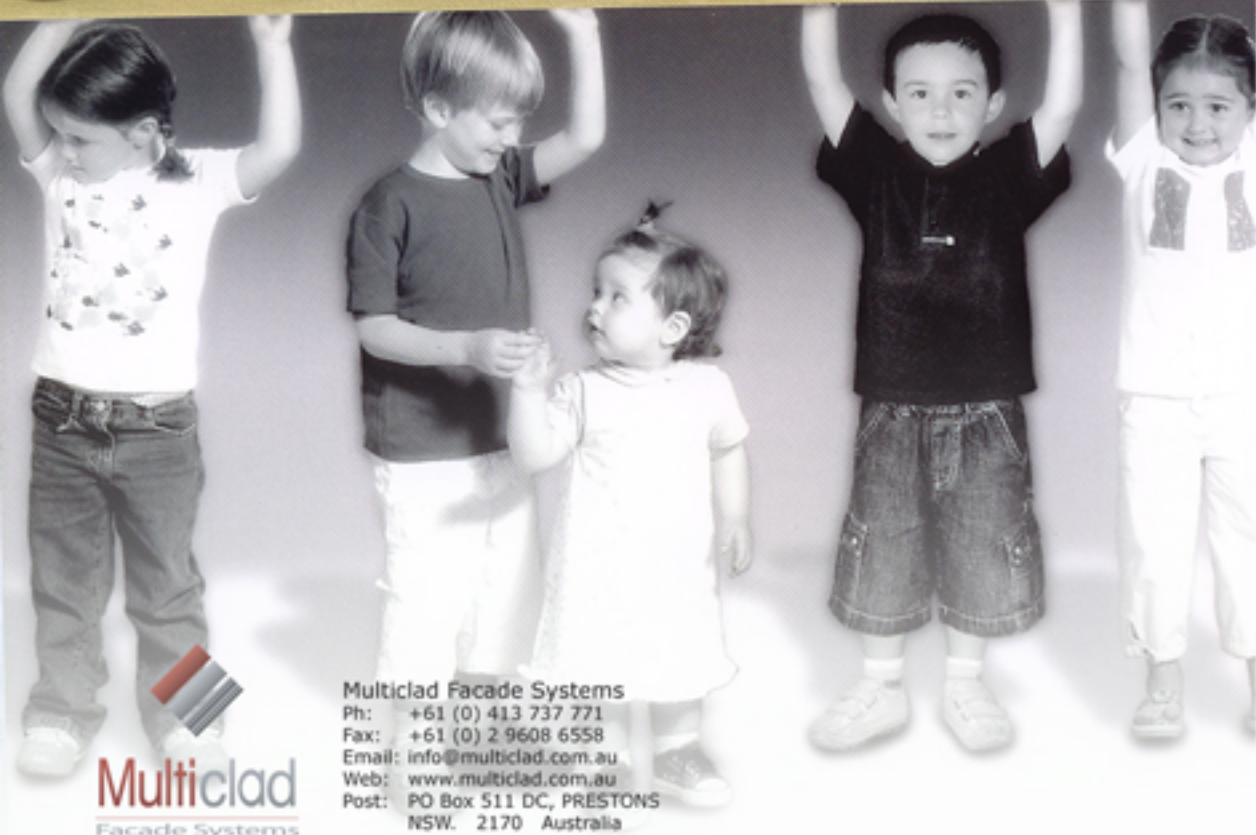

This virtuous circle leads us to refine the distinctive skills of the Group and to develop the provision of services to our customers in a circle of common growth.
