

A STEP IN THE RIGHT PROTECTION

Protecting floors during construction is imperative. Most projects suffer from the pressures of tight schedules and tighter margins as the building industry becomes increasingly competitive. Combining this with the trend towards materials that are better suited to wall art than floor coverings, the importance of protection during construction has never been so important.

Combating the problem of beautiful timber flooring, or stunning porcelain tiles – traditionally protected under plastic during the construction phase – becoming scuffed, marked and damaged, the **new Rf200** coating is the hassle-free solution and can mean the difference between profit and loss on a contract.

Rf200 protects under light impact, water, and most solvents and does not allow grit or contaminants to get between itself and the surface it protects. The removal process is as easy as removing masking tape and leaves the surface dust free and perfectly kept.

Skudo Coatings – A wholly Australian owned company have taken the initiative and developed a revolutionary product which can be applied to almost any floor type internally. The product - **Rf200** is a two coat application and is applied using either roller, brush, or spray. Once the coating has been applied and left to dry, the floor coat can withstand heavy traffic and will remain totally protective until you are ready to remove.

For more information on the **Rf200** from Skudo Coatings please email info@skudo.com.au or call **0403 519 323**
